(1)
$$m(\dot{r}-\dot{r}\dot{o}^{2})=-\frac{GMM}{\dot{r}^{2}}, \quad m\cdot\frac{1}{\dot{r}}\frac{d}{dt}\left(\dot{r}^{2}\frac{do}{dt}\right)=0$$

$$L \bigcirc$$

(2)
$$E = \frac{1}{2}mv^2 + V$$

$$\dot{o} = \frac{h}{F^2} + \dot{y}$$
 $E = \frac{1}{2}m(\dot{f}^2 + \frac{h^2}{F^2}) - \frac{GMm}{F}$

hは定数 ← point なので

$$\frac{dE}{dt} = \frac{1}{2}m(2\dot{i}\dot{i} - \frac{2\dot{h}^{2}}{\dot{h}^{3}} \cdot \dot{i}) + \frac{GMm}{\dot{h}^{2}} \cdot \dot{i}$$

$$= m\dot{i}(\dot{i} - \frac{\dot{h}^{2}}{\dot{h}^{3}}) + \frac{GMm}{\dot{h}^{2}} \cdot \dot{i}$$

$$\frac{dE}{dt} = m\dot{f}\left(-\frac{GM}{f^2}\right) + \frac{GMm}{f^2} \cdot \dot{f} = 0$$
